Wildlife of the Galápagos Islands These currents cool the islands and provide the perfect environment for the wildlife there. The Galápagos are located at the confluence of several currents including the cold Humboldt Current travelling north from South America and the Panama Current travelling south from Central America. evolved into new species. One The Galápagos Islands are off the west coast of South America straddling the equator. It was after visiting the Galápagos and studying the wildlife that a young Charles Darwin developed his theory of evolution f3be59a1c8

The islands are volcanic in origin and were never attached to any continent. Galápagos wildlife arrived by flying, floating or swimming. Birds might have flown there by accident and decided to settle there due to favourable conditions. Mammals or reptiles might have floated on a piece of wood and drifted to the islands. Some animals like marine iguanas, may have swum there. In most environments the larger mammals are the... f3be59a1c8
