Mirror Light that bounces off a mirror forms an image of whatever is in front of it, which is then focused through the lens of the eye or a camera. Mirrors reverse the direction of light at an angle equal to its incidence. In modern mirrors, metals like silver or aluminium are often used due to their high reflectivity, applied as a thin coating on. moving at an extremely high velocity. Such mirrors A mirror, also known as a looking glass, is an object that reflects an image. A phase-conjugating mirror uses nonlinear optics to reverse the phase difference between incident beams. Natural mirrors have existed since prehistoric times, such as the surface of water, but people have been manufacturing mirrors out of a variety of materials for thousands of years, like stone, metals, and glass. This allows the viewer to see themselves or objects behind them, or even objects that are at an angle from them but out of their field of view, such as around a corner

Download the file enwiki-YYYYMMDD-pages-articles.xml.bz2 from the most recent dump. For example, on your.org, go to directory YYYYMMDD for the most recent date (for example 20171020), and retrieve the requested file (for example enwiki-20171020-pages-articles.xml.bz2). purge Crystal radios are the simplest type of radio receiver and can be made with a few inexpensive parts, such as a wire for an antenna, a coil of wire, a capacitor, a crystal detector, and earphones. However they are passive receivers, while other radios use an amplifier powered by current from a battery or wall outlet to make the radio signal louder. Thus, crystal sets produce rather weak sound and must be listened... misc

Compressed sensing Compressed sensing has applications in, for example, magnetic resonance imaging (MRI) where the incoherence. technique for efficiently acquiring and reconstructing a signal by finding solutions to underdetermined linear systems. This is based on the principle that Compressed sensing (also known as compressive sensing, compressive sampling, or sparse sampling) is a signal processing technique for efficiently acquiring and reconstructing a signal by finding solutions to underdetermined linear systems. There are two conditions under which recovery is possible. This is based on the principle that, through optimization, the sparsity of a signal can be exploited to recover it from far fewer samples than required by the Nyquist-Shannon sampling theorem. The second one is incoherence, which is applied through the isometric property, which is sufficient for sparse signals. The first one is sparsity, which requires the signal to be sparse in some domain

List of Japanese inventions and discoveries pp. 1–2. Springer Nature. Nonlinear Oscillations: Exact Solutions and their Approximations. This is a list of Japanese inventions and discoveries. Retrieved 16 April 2020. Japanese pioneers have made contributions across a number of scientific, technological and art domains. Kovacic, Ivana (14 August 2020). In particular, Japan has played a crucial role in the digital revolution since the 20th century, with many modern revolutionary and widespread technologies in fields such as electronics and robotics introduced by Japanese inventors and entrepreneurs

List of datasets for machine-learning research "Datasets These datasets are used in machine learning (ML) research and have been cited in peer-reviewed academic journals. High-quality labeled training datasets for supervised and semi-supervised machine learning algorithms are usually difficult and expensive to produce because of the large amount of time needed to label the data. Although they do not need to be labeled, high-quality datasets for unsupervised learning can also be difficult and costly to produce. Major advances in this field can result from advances in learning algorithms (such as deep learning), computer hardware, and, less-intuitively, the availability of high-quality training datasets. Datasets are an integral part of the field of machine learning. over 25 different use cases. Crystal radio detector of radio waves in 1894 by Jagadish Chandra Bose, in his microwave optics experiments. It uses only the power of the received radio signal to produce sound, needing no external power. It is named for its most important component, a crystal detector, originally made from a piece of crystalline mineral such as galena. They were first used as a demodulator for radio communication A crystal radio receiver, also called a crystal set, is a simple radio receiver, popular in the early days of radio. This component is now called a diode [ce1fe0d9f4](#)
