Combustion , using a lit match to light a fire), the heat from a flame may provide enough energy to make the reaction self-sustaining. While activation energy must be supplied to initiate combustion (e. g. Combustion does not always result in fire, because a flame is only visible when substances undergoing combustion vaporize, but when it does, a flame is a characteristic indicator of the reaction. Oxidants for combustion have high oxidation potential and include atmospheric or pure oxygen, chlorine, fluorine, chlorine trifluoride Combustion, or burning, is a high-temperature exothermic redox chemical reaction between a fuel (the reductant) and an oxidant, usually atmospheric oxygen, that produces oxidized, often gaseous products, in a mixture termed as smoke. The study of combustion is known as combustion science. nonhazardous and hazardous e39d4c5f66
