Development of the adult attachment theory and adult attachment measures in the 1990s provided researchers with the means to apply the attachment theory to health in a more systematic way. In 1982, American psychiatrist Lawrence Kolb noticed that patients with chronic pain displayed behaviours with their healthcare providers akin to what children might display with an attachment figure, thus marking one of the first applications of the attachment theory to physical health. Since that time, it has been used to understand variations in stress response, health outcomes and health behaviour 6a56c9973d
