Medical historians often draw from other humanities fields of study including economics, health sciences, sociology, and politics to better understand the institutions, practices, people, professions, and social systems that have shaped medicine. When a period which predates or lacks written sources regarding medicine, information is instead drawn from archaeological sources. Anatomy Anatomy is inherently tied to developmental biology, embryology, comparative anatomy, evolutionary biology, and phylogeny, as these are the processes by which anatomy is generated, both over immediate and long-term timescales. Human anatomy is one of the essential basic. Anatomy is a branch of natural science that deals with the structural organization of living things. anatomy is generated, both over immediate and long-term timescales. It is an old science, having its beginnings in prehistoric times. Anatomy and physiology, which study the structure and function of organisms and their Anatomy (from Ancient Greek ἀνατομή (anatomé) 'dissection') is the branch of morphology concerned with the study of the internal and external structure of organisms and their parts. Anatomy and physiology, which study the structure and function of organisms and their parts respectively, make a natural pair of related disciplines, and are often studied together ea43813155

To accommodate smoother penetration of the vagina during sexual intercourse or other sexual activity, vaginal moisture increases during sexual arousal in human females and other female mammals. This increase in moisture provides vaginal lubrication, which reduces friction. The texture of the vaginal walls creates... ea43813155

Ibn al-Nafis The work of Ibn al-Nafis regarding the right sided (pulmonary) circulation pre-dates the later work (1628) of William Harvey's *De motu cordis*. included medicine, surgery, physiology, anatomy, biology, Islamic studies, jurisprudence, and philosophy. He is known for being the first to describe the pulmonary circulation of the blood. The 2nd century Greek physician Galen's theory about the physiology of the circulatory system remained unchallenged until the works of Ibn al-Nafis, who has therefore been described as "the father of circulatory physiology". Both theories attempt to explain circulation. He is known for being the first to describe ‘Alā’ al-Dīn Abū al-Ḥasan ‘Alī ibn Abī Ḥazm al-Qarashī (Arabic: أبو الحسن علي بن أحمد القرشي), known as Ibn al-Nafis (Arabic: ابن النفيس), was an Arab polymath whose areas of work included medicine, surgery, physiology, anatomy, biology, Islamic studies, jurisprudence, and philosophy ea43813155

Clinical anatomy: applied anatomy for students and junior doctors (13th ed. Chichester, West Sussex, UK: Wiley-Blackwell The human female reproductive system is made up of the internal and external sex organs that function in the reproduction of new offspring. The reproductive system is immature at birth and develops at puberty to be able to release matured ova from the ovaries, facilitate their fertilization, and create a protective environment for the developing fetus during pregnancy. The female reproductive tract is made of several connected internal sex organs—the vagina, uterus, and fallopian tubes—and is prone to infections.
