Hypertrophic osteodystrophy The Merck Veterinary Hypertrophic Osteodystrophy (HOD) is a bone disease that occurs most often in fast-growing large and giant breed dogs; however, it also affects medium breed animals like the Australian Shepherd. HOD is characterized by decreased blood flow to the metaphysis (the part of the bone adjacent to the joint) leading to a failure of ossification (bone formation) and necrosis and inflammation of cancellous bone. The disorder is sometimes referred to as

metaphyseal osteopathy, and typically first presents between the ages of 2 and 7 months. Textbook of Veterinary Diagnostic Radiology (2nd ed. W.). "Hypertrophic Osteodystrophy";. B. Saunders Company. ISBN 0-7216-3143-6. The disease is usually bilateral in the limb bones, especially the distal radius, ulna, and tibia

Diagnostic techniques include X-ray, computed tomography, and surgical techniques such as an explorative surgery. Diagnosis is often difficult because signs may not show up on X-ray, or signs that do show up appear similar to other conditions. Signs and symptoms include chest and abdominal pain, difficulty breathing, and decreased lung sounds. When a tear is discovered, surgery is needed to repair it.
