Complex system The 2021 Nobel Prize in Physics was awarded to Syukuro Manabe, Klaus A complex system is a system composed of many components that may interact with one another. Examples of complex systems are Earth's global climate, organisms, the human brain, infrastructure such as power grid, transportation or communication systems, complex software and electronic systems, social and economic organizations (like cities), an ecosystem, a living cell, and, ultimately, for some authors, the entire universe. mostly based on the complex systems theory and the chaos theory for economics analysis f5e3f9039b

Self-organization It is often triggered by seemingly random fluctuations, amplified by positive feedback. Therefore, because the Self-organization, also called spontaneous order in the social sciences, is a process where some form of overall order arises from local interactions between parts of an initially disordered system. with structure spreading out in space and time over every available scale, as shown for example by Per Bak and his collaborators. As such, the organization is typically robust and able to survive or self-repair substantial perturbation. The process can be spontaneous when sufficient energy is available, not needing control by any external agent. Chaos theory discusses self-organization in terms of islands of predictability in a sea of chaotic unpredictability. The resulting organization is wholly decentralized, distributed over all the components of the system f5e3f9039b
