Snow Major snow-prone areas include the polar regions, the northernmost half of the Northern Hemisphere, and mountainous Snow consists of individual ice crystals that grow while suspended in the atmosphere—usually within clouds—and then fall, accumulating on the ground where they undergo further changes. streams and rivers and recharging groundwater. It consists of frozen crystalline water throughout its life cycle, starting when, under suitable conditions, the ice crystals form in the atmosphere, increase to millimeter size, precipitate and accumulate on surfaces, then metamorphose in place, and ultimately melt, slide, or sublimate away 38ee834880

Snowstorms organize and develop by feeding on sources of atmospheric moisture and cold air. Snowflakes nucleate around particles in the atmosphere by attracting supercooled water droplets, which freeze in hexagonal-shaped crystals. Snowflakes take on a variety of shapes, basic among these are platelets, needles, columns... 38ee834880 The list contains 50,052 articles. --Cewbot (talk) 14:18, 26 August 2025 (UTC) 38ee834880 "Limnology", 38ee834880 "Spring (hydrology)", 38ee834880
