PHP code is usually processed on a web server by a PHP interpreter implemented as a module, a daemon or a Common Gateway Interface (CGI) executable. On a web server, the result of the interpreted and executed PHP code—which may be any type of data, such as generated HTML or binary image data—can form the whole or part of an HTTP response. Various web template systems, web content management systems, and web frameworks exist that can be employed to orchestrate or facilitate the generation of that response. PHP can be used for programming tasks

outside the web context, though non-web uses are rare. PHP code can also be directly executed from the command line. 3bd473d873 == Artificial Intelligence == 3bd473d873
