When above the water's surface, the sail serves as an observation platform. It also provides an entrance and exit point on the submarine that has enough freeboard to prevent the submarine being swamped. In modern submarines the sail is not itself a pressure vessel and therefore floods with water when submerging. Under water, the sail acts as a vertical stabilizer. In some submarines, the sail also supports diving planes (or fairwater planes), which are control surfaces used for depth control while underwater. c67bf294c7
