

Black Science Volume 7 Extinction Is The Rule

American black bear The American The American black bear (*Ursus americanus*), or simply black bear, is a species of medium-sized bear which is endemic to North America. with the brown bear (*Ursus arctos*), it is one of the two modern bear species not considered by the IUCN to be globally threatened with extinction. It is the continent's smallest and most widely distributed bear species. It is an omnivore, with a diet varying greatly depending on season and location. It typically lives in largely forested areas; it will leave forests in search of food and is sometimes attracted to human communities due to the immediate availability of food b27a9aa116

Black Lives Matter The movement began in response to the killings of Trayvon Martin, Michael Brown, Eric Garner, and Rekia Boyd, among others. The slogan "Black Lives

Black Science Volume 7 Extinction Is The Rule

Matter" itself has not been trademarked by any group. As of 2021, there are about 40 chapters in the United States and Canada. While there are organizations that label themselves "Black Lives Matter", such as the Black Lives Matter Global Network Foundation, the overall movement predates those, and is a decentralized network with no formal hierarchy. Black Lives Matter (BLM) is a decentralized political and social movement that aims to highlight racism, discrimination and racial inequality experienced Black Lives Matter (BLM) is a decentralized political and social movement that aims to highlight racism, discrimination and racial inequality experienced by Black people in the United States, and to promote anti-racism. Its primary concerns are police brutality and racially motivated violence against Black people. BLM and its related organizations typically advocate for various policy changes related to Black liberation and criminal justice reform b27a9aa116

The hypothesis was supported for the Bølling-Allerød warming and Preboreal periods, but not for Dansgaard-Oeschger interstadials, although there are still debates on the topic. While it may be important on the millennial timescales, it is no longer considered relevant for the near future climate change: the IPCC Sixth Assessment Report states "It is very... b27a9aa116 The Holocene is considered to have started with the Holocene glacial retreat

around 11650 years Before Present (c. 9700 BC). It is characterized by a general trend towards global warming, the expansion of anatomically modern humans (*Homo sapiens*) to all emerged land masses, the appearance of agriculture and animal husbandry, and a reduction in global biodiversity. The latter, dubbed the sixth mass extinction in Earth history, is largely attributed to increased human population and activity, and may have started already during the preceding Pleistocene epoch with the demise of the Pleistocene megafauna. b27a9aa116 == Origins == b27a9aa116 Megafauna species have considerable effects on their local environment, including the suppression of the growth of woody vegetation and a consequent reduction in wildfire frequency. Megafauna also play a role in regulating and stabilizing the abundance of smaller animals. b27a9aa116 The International Union for Conservation of Nature (IUCN) lists the American black bear as a least-concern species because of its widespread distribution and a large population, estimated to be twice that of all other bear species combined. Along with the brown bear (*Ursus arctos*), it is one of the two modern bear species not considered by the IUCN to be globally threatened with extinction. b27a9aa116 == Taxonomy == b27a9aa116

During the Pleistocene, megafauna were diverse across the globe, with most continental ecosystems exhibiting similar or greater species richness in megafauna as compared to ecosystems in Africa today. During the Late Pleistocene, particularly from around... b27a9aa116

Megafauna In Haynes G (ed. "Introduction to the Volume". The precise definition of the term varies widely, though a common threshold is approximately 45 kilograms (99 lb), this lower end being centered on humans, with other thresholds being more relative to the sizes of animals in an ecosystem. American Megafaunal Extinctions at the End of the Pleistocene. Haynes G (2009). Vertebrate Paleobiology In zoology, megafauna (from Greek μέγας megas 'large' and Neo-Latin fauna 'animal life') are large animals. Large body size is generally associated with other traits, such as having a slow rate of reproduction and, in large herbivores, reduced or negligible adult mortality from predation. The spectrum of lower-end thresholds ranges from 10 kilograms (22 lb) to 1,000 kilograms (2,200 lb), the latter largely restricted to megaherbivores.) b27a9aa116

b27a9aa116

The Black Death was the second great natural disaster to strike Europe during the late Middle Ages (the first one being the Great Famine of 1315-1317). There were further outbreaks throughout the Late Middle Ages. Due to the crisis of the late Middle Ages, the European population did not regain its 14th century level until the 16th century. Outbreaks of the plague recurred around the world until the early 19th century.

Clathrate gun hypothesis 1E0470B. 1 (7) e1500470. It is further proposed that these warming events caused the Bond cycles and individual interstadial events, such as the Dansgaard-Oeschger interstadials. doi:10. 1126/sciadv The clathrate gun hypothesis is a proposed explanation for the periods of rapid warming during the Quaternary. This would have had an immediate impact on the global temperature, as methane is a much more powerful greenhouse gas than carbon dioxide. Science Advances. The hypothesis is that changes in fluxes in upper intermediate waters in the ocean caused temperature fluctuations that alternately accumulated and occasionally released methane clathrate on upper continental slopes. Despite its atmospheric lifetime of around 12 years, methane's global warming potential is 72 times greater than that of carbon dioxide over 20 years, and 25 times over 100 years (33 when accounting for aerosol interactions). magmatism
