Internal combustion engines are often cooled by circulating a liquid called engine coolant through the engine block and cylinder head where it is heated, then through a radiator where it loses heat to the atmosphere, and then returned to the engine. Engine coolant is usually water-based, but may also be oil. It is common to employ a water pump to force the engine coolant to circulate, and also for an axial fan to force air through the radiator. 199836b065 In the 1930s, Haynes, a rated command pilot, led experimental long-range over-water interception flights that were key to the development of U.S. air defense doctrine. Haynes demonstrated by piloting one of the bombers that intercepted the Italian liner SS Rex that enemy ships could be located and sunk by American aircraft. As well, Haynes helped promote air power by flying long range missions to various countries in South America. 199836b065
