Locking differential Sensors monitor wheel speeds, and if one is rotating more than a specified number of revolutions A locking differential is a mechanical component, commonly used in offroad vehicles, designed to overcome the chief limitation of a standard open differential by essentially "locking" both wheels on an axle together as if on a common shaft. This forces, in contrast to the more common limited slip differential (LSD) in roadgoing cars, both wheels to turn in unison, regardless of the traction (or lack thereof) available to either wheel individually. not in fact a differential lock, but operates at each wheel b031ecc152
