In placental mammals, urine enters the bladder via the ureters and exits via the urethra during urination. a hollow organ in humans and other vertebrates that stores urine from the kidneys. The typical adult human bladder will hold between 300 and 500 ml (10 and 17 fl oz) before the urge to empty occurs, but can hold considerably more. In humans, the bladder is a distensible organ that sits on the pelvic floor 8d46a324a6

Anatomy Human anatomy is one of the essential basic. It is an old science, having its beginnings in prehistoric times. is inherently tied to developmental biology, embryology, comparative anatomy, evolutionary biology, and phylogeny, as these are the processes by which Anatomy (from Ancient Greek ἀνατομή (anatomé) 'dissection') is the branch of morphology concerned with the study of the internal and external structure of organisms and their parts. Anatomy is inherently tied to developmental biology, embryology, comparative anatomy, evolutionary biology, and phylogeny, as these are the processes by which anatomy is generated, both over immediate and long-term timescales. Anatomy is a branch of natural science that deals with the structural organization of living things. Anatomy and physiology, which study the structure and function of organisms and their parts respectively, make a natural pair of related disciplines, and are often studied together 8d46a324a6

Stomach "Diseases of the Stomach: A Manual for Practitioners and Students,"Chicago Medical Book Company, 1909, page 11. The stomach is involved in the gastric phase of digestion, following the cephalic phase in which the sight and smell of food and the act of chewing are stimuli. It also plays a role

in regulating gut microbiota, influencing digestion and overall health. In the stomach a chemical breakdown of food takes place by means of secreted digestive enzymes and gastric acid. The stomach has a dilated structure and functions as a vital organ in the digestive system. The Ancient Greek name for the stomach is gaster which is used as gastric in medical terms related to the stomach. [2] Weber, John and Shearer, Edwin Morrill The stomach is a muscular, hollow organ in the upper gastrointestinal tract of humans and many other animals, including several invertebrates 8d46a324a6

Richard M. Eakin research focused on eyes and vision in animals, especially the parietal eye or "third eye" of vertebrates, as well as animal embryology. His research focused on eyes and vision in animals, especially the parietal eye or "third eye" of vertebrates, as well as animal embryology. He served as chairman Richard Marshall Eakin (AY-kin; May 5, 1910 – November 25, 1999), was an American zoologist and professor at the University of California, Berkeley. He served as chairman of the UC Berkeley Department of Zoology for over 10 years, was elected president of the Western Society of Naturalists and American Society of Zoologists, and was a fellow of the California Academy of Sciences. A 1953 Guggenheim fellow, he wrote several books and more than 200 scientific papers. He was widely known for portraying prominent historical scientists during some of his lectures; dressing in costume and speaking in character to entertain and inform his students 8d46a324a6

The Latin phrase for "urinary bladder" is vesica urinaria, and the term vesical or prefix vesico- appear in connection with associated structures such as vesical veins. The modern Latin word for "bladder" – cystis – appears in associated terms such as cystitis (inflammation of the bladder). 8d46a324a6 The thyroid gland secretes three hormones: the two thyroid hormones – triiodothyronine (T3) and thyroxine (T4) – and a peptide hormone, calcitonin. Thyroid Microscopically, the functional unit of the thyroid gland is the spherical thyroid follicle, lined with follicular cells (thyrocytes), and occasional parafollicular cells that surround a lumen containing colloid. The lower two thirds of the lobes are connected by a thin band of tissue called the isthmus (pl. : isthmi). The thyroid, or thyroid gland, is an endocrine gland in vertebrates. In humans, it is a butterfly-shaped gland located in the neck below the Adam's apple. Neuroscience The vertebrate nervous Neuroscience is the scientific study of the nervous system (the brain, spinal cord, and peripheral nervous system), its functions, and its disorders. points. It is a multidisciplinary science that combines physiology, anatomy, molecular biology, developmental biology, cytology, psychology, physics, computer science, chemistry, medicine, statistics, and mathematical modeling to understand the fundamental and emergent properties of neurons, glia and neural circuits. A nervous system emerges from the assemblage of neurons that are connected to each other in neural circuits, and networks. The understanding of the biological basis of learning, memory, behavior, perception, and consciousness has been described by Eric Kandel as the "epic challenge" of the biological sciences 8d46a324a6
