Plastic As of January Plastics are a wide range of synthetic or semisynthetic materials composed primarily of polymers. This adaptability, combined with a wide range of other properties such as low weight, durability, flexibility, chemical resistance, low toxicity, and low-cost production, has led to their widespread use around the world. While most plastics are produced from natural gas and petroleum, a growing minority are produced from renewable resources like polylactic acid. recent animal study suggests that even low-level exposure to BPA results in insulin resistance, which can lead to inflammation and heart disease. Their defining characteristic, plasticity, allows them to be molded, extruded, or pressed into a diverse range of solid forms
