Graphics processing unit GPUs were later found to be useful for non-graphic calculations involving embarrassingly parallel problems due to their parallel structure. to their chips. Other non-graphical uses include the training of neural networks and cryptocurrency mining. Fixed-function Windows accelerators surpassed expensive general-purpose graphics coprocessors in Windows performance, and such coprocessors A graphics processing unit (GPU) is a specialized electronic circuit designed for digital image processing and to accelerate computer graphics, being present either as a component on a discrete graphics card or embedded on motherboards, mobile phones, personal computers, workstations, and game consoles. The ability of GPUs to rapidly perform vast numbers of calculations has led to their adoption in diverse fields including artificial intelligence (AI) where they excel at handling data-intensive and computationally demanding tasks

List of Internet pioneers These contributions include theoretical foundations, building early networks, specifying protocols, and expansion beyond a research tool Instead of having a single inventor, the Internet was developed by many people over many years. These contributions include theoretical foundations, building early networks, specifying protocols, and expansion beyond a research tool to wide deployment. The following people are Internet pioneers who have been recognized for their contribution to its early and ongoing development. ongoing development

Windows 95 1 to a 32-bit preemptive multitasking architecture. There were also major changes made to the core components of the operating system, such as moving from a mainly cooperatively multitasked 16-bit architecture of its predecessor Windows 3. Windows 95 merged Microsoft's formerly separate MS-DOS and Microsoft Windows products into a single product and featured significant improvements over its predecessor, most notably in the graphical user interface (GUI) and in its simplified "plug-and-play" features. Multiprocessing There are many variations on this basic theme, and the definition of multiprocessing can vary with context, mostly as a function of how CPUs are defined (multiple cores on one die, multiple dies in one package, multiple packages in one system unit, etc. The term also refers to the ability of a system to support more than one processor or the ability to allocate tasks between them. lockout OpenHMPP Raj Rajagopal (1999). ISBN 978-1-4200-7548-9 Multiprocessing (MP) is the use of two or more central processing units (CPUs) within a single computer system ae4d74558e

A multiprocessor is a computer system having two or more processing units (multiple processors) each sharing main memory and peripherals, in order to simultaneously process programs. The OpenBSD project maintains portable versions of many subsystems as packages for other operating systems. Because of the project's preferred BSD license, which allows binary redistributions without the source code, many components are reused in proprietary and corporate-sponsored software projects.
