Internal combustion engine The force is typically applied to pistons (piston engine), turbine
blades (gas turbine), a rotor (Wankel engine), or a nozzle (jet engine). In an internal
combustion engine, the expansion of the high-temperature and high-pressure gases
produced by combustion applies direct force to some component of the engine. An internal
combustion engine (ICE or IC engine) is a heat engine in which the combustion of a fuel
occurs with an oxidizer (usually air) in a combustion An internal combustion engine (ICE or
IC engine) is a heat engine in which the combustion of a fuel occurs with an oxidizer
(usually air) in a combustion chamber that is an integral part of the working fluid flow
circuit. This force moves the component over a distance. This process transforms chemical
energy into kinetic energy which is used to propel, move or power whatever the engine is
