Methamphetamine The level of needle sharing among methamphetamine users is similar to that among other drug injection users. The Methamphetamine (contracted from N-methylamphetamine) is a potent central nervous system (CNS) stimulant that is mainly used as a recreational or performance-enhancing drug and less commonly as a second-line treatment for attention deficit hyperactivity disorder (ADHD). Methamphetamine is rarely prescribed over concerns involving its. It has also been researched as a potential treatment for traumatic brain injury. between users who share a common needle. Methamphetamine properly refers to a specific chemical substance, the racemic free base, which is an equal mixture of levomethamphetamine and dextromethamphetamine in their pure amine forms, but the hydrochloride salt, commonly called crystal meth, is widely used. Methamphetamine was discovered in 1893 and exists as two enantiomers: levo-methamphetamine and dextro-methamphetamine 50e35c25be

 50e35c25be The result was no consensus. Those advancing a delete argument suggest that the coverage out there does
 not meet the criteria of the GNG and thus this flight is not notable. Those advocating keep suggest that there are several
 distinguishing factors about this particular flight for which there are RS to thus demonstrate notability. As there has been
 extensive discussion on these two points and no agreement, a no consensus close is merited here at this time.
