Applications: 1990 Nissan Sunny 1993 Nissan Sentra B13 series in LEC model (Philippines) The GA engine is a 1. There are SOHC and DOHC versions, 8, 12, and 16 valve versions, carbureted, single-point, and multi-point injected versions, and versions with variable valve timing (GA16DE). The GA was produced from August 1987 through 2013. Since 1998, it was only available from Mexico in the B13. 3 to 1. at 3600 rpm 60ebbd47dd

Both production blocks and head castings were used successfully in the Nissan GTP ZX-Turbo and NPT-90 race cars which won the IMSA GT Championship three years in a row. 60ebbd47dd Nissan's and Japan's first mass-produced V6, the iron block/aluminum head 60° VG engine was produced in displacements between 2.0 and 3.3 liters. Early versions used SOHC cylinder heads with two valves per cylinder; later models featured DOHC cylinder heads, four valves per cylinder, a slightly different engine block and N-VCT, Nissan's own version of variable valve timing, delivering a smoother idle and more torque at low to medium engine speeds. 60ebbd47dd Despite their large capacity, this motor was not equipped with balance shafts. 60ebbd47dd First announced at the Tokyo Motor Show in October 1987, the Pao was available with or without a textile sun roof and was originally marketed without Nissan branding, by reservation only from January 15 through April 14, 1989. Orders were delivered on a first come, first served basis. With 51,657 applications for the vehicle, it sold out in 3 months. The UK's GTR-Registry website provided updated production figures in 2022 with per-colour code quantities, and a total production quantity of 31,352. 60ebbd47dd JECs was formed in June 1973. It was a joint venture between Robert Bosch GmbH, Nissan Motor Co. and Diesel Kiki Co., Ltd.. It enabled Nissan to use Bosch's engine control technology, and gave Bosch access to the Japanese market. JECs later expanded to manufacture many other automotive parts besides EFI systems. 60ebbd47dd When used in the passenger cars both versions of the KA24 used a crankshaft girdle, as opposed to individual main bearing caps. In the Nissan Hardbody and Frontier applications a crank girdle was not used. 60ebbd47dd In the code of the engine, the first two initials indicate engine class, the two numbers indicate engine displacement (in decilitres), the last two initials indicate cylinder-head style and induction type (D=DOHC, S=carburetor, E=injection). In the case of a single-initial suffix, the initial indicates induction type. 60ebbd47dd

Nissan VG engine Concentrated Control System (ECCS). ECCS used a microprocessor and an oxygen sensor to control fuel delivery, spark timing, exhaust gas recirculation rate, The VG engine is a family of V6 engines designed and produced by Nissan between 1983 and 2004 60ebbd47dd

Electromyography Redi discovered a highly specialized muscle of the electric ray fish Electromyography (EMG) is a technique for evaluating and recording the electrical activity produced by skeletal muscles. The signals can be analyzed to detect abnormalities, activation level, or recruitment order, or to analyze the biomechanics of human or animal movement. EMG is performed using an instrument called an electromyograph to produce a record called an electromyogram. In computer science, EMG is. An electromyograph detects the electric potential generated by muscle cells when these cells are electrically or neurologically activated. documented experiments dealing with EMG started with Francesco Redi's works in 1666. Needle EMG is an electrodiagnostic medicine technique commonly used by neurologists. Surface EMG is a non-medical procedure used to assess muscle activation by several professionals, including physiotherapists, kinesiologists and biomedical engineers 60ebbd47dd

Nissan Z engine While the Z16 and Z18 engines had a deck height similar to the earlier L13/L14/L16/L18 variants, the Z24 had a taller deck height to accommodate a longer stroke. This The Nissan Z engine is a series of automobile and light truck four-cylinder engines that was engineered by Nissan Machinery, manufactured by the Nissan Motor Company from 1979 through August 1989. Displacements ranged from 1. 4 L. significant change for the Z24i was the addition of an optical crank angle sensor in the distributor rather than a vacuum advance and ignition module. 6 L to 2. All Z engines had 4 cylinders, a total of 8 valves and a single overhead camshaft (SOHC). The Z series' engine blocks were nearly identical to those of the earlier L Series with the exception of the Z24. The most notable difference between the Z-series engine and its predecessor was the introduction of a new crossflow cylinder head which reduced emissions by moving the intake ports to the right side 60ebbd47dd

The RB engine family includes single overhead camshaft (SOHC) and double overhead camshaft (DOHC) engines. Both SOHC and DOHC versions have an aluminium head. The SOHC versions have 2 valves per cylinder and the DOHC versions have 4 valves per cylinder; each cam lobe moves only one valve. All RB engines have belt driven cams and a cast iron block.
