Blowout preventer Based on BP’s video feeds A blowout preventer (BOP) (pronounced B-O-P) is a specialized valve or similar mechanical device, used to seal, control and monitor oil and gas wells to prevent blowouts, the uncontrolled release of crude oil or natural gas from a well. 10, 2010, BP began operations to install a sealing cap, also known as a capping stack, atop the failed blowout preventer stack. They are usually installed in stacks of other valves 09abf24155

BP's origins date back to the founding of the Anglo-Persian Oil Company in 1909, established as a subsidiary of Burmah Oil Company to exploit oil discoveries in Iran. In 1935, it became the Anglo-Iranian Oil Company and in 1954, adopted the name British Petroleum. 09abf24155 Shutdown valves are primarily associated with the petroleum industry although other industries may also require this type of protection system. ESD valves are required by law on any equipment placed on an offshore drilling rig to prevent catastrophic events like the BP Horizon explosion in the Gulf of Mexico... 09abf24155

List of medical abbreviations also recast the sentence to avoid it. They boost efficiency as long as they are used intelligently. The advantages of brevity should be weighed against the possibilities of obfuscation (making the communication harder for others to understand) and ambiguity (having more than one possible interpretation). Certain medical abbreviations are avoided to prevent mistakes, according to best practices (and in some cases regulatory requirements); these are flagged in the list of abbreviations used in medical prescriptions. The effect of BP on MI risk is multifaceted. Example: BP’s effect on risk of MI is multifaceted. Arrows may be used Abbreviations are used very frequently in medicine 09abf24155

Shutdown valves form part of a safety instrumented system. The process of providing automated safety protection upon the detection of a hazardous event is called functional safety. 09abf24155

Deepwater Horizon oil spill Caused in the aftermath of a blowout and explosion on the Deepwater Horizon oil platform, the United States federal government estimated the total discharge at 4. 9 million barrels (210,000,000 US gal; 780,000 m3). Reports in early 2012 indicated that the well site was still leaking. After several failed efforts to contain the flow, the well was declared sealed on 19 September 2010. Newsweek showed that BP did not hand out the legally required safety manual for use with Corexit, and were not provided with safety training or protective The Deepwater Horizon oil spill was an environmental disaster beginning 20 April 2010 off the coast of the United States in the Gulf of Mexico, on the BP-operated Macondo Prospect. The Deepwater Horizon. It is considered the largest marine oil spill in the history of the petroleum industry and estimated to be 8 to 31 percent larger in volume than the previous largest, the Ixtoc I oil spill, also in the Gulf of Mexico 09abf24155

Subsequent investigation reports by BP, the U. 1 billion), costs of repairs, deferred production, and fines, the explosion is the world's costliest refinery accident. Property loss was \$200 million (\$322 million in 2024). All the fatalities were contractors working out of temporary buildings located close to the unit to support turnaround activities. Right to know This is in addition to requirements by other federal agencies, like the Right to know is a human right enshrined in law in several countries. It pursues universal access to information as essential foundation of inclusive knowledge societies. It is often defined in the context of the right for people to know about their potential exposure to environmental conditions or substances that may cause illness or injury, but it can also refer more generally to freedom of information or informed consent. Transportation also regulates mandatory labeling requirements for all hazardous materials. UNESCO defines it as the right for people to "participate in an informed way in decisions that affect them, while also holding governments and others accountable" 09abf24155

Shutdown valve A safety shutoff valve should be fail-safe, that is close A shutdown valve (also referred to as SDV or emergency shutdown valve, ESV, ESD, or ESDV; or safety shutoff valve) is an actuated valve designed to stop the flow of a hazardous fluid upon the detection of a dangerous event. BP acquired majority control of Standard... 09abf24155 The earliest blowout preventers; Regan Type K Annulars were used, beginning in the 1930s to cope with extreme erratic pressures and uncontrolled flow (formation kick) emanating from a well reservoir during drilling. Kicks can lead to a potentially catastrophic event known as a blowout. In addition to controlling the downhole (occurring in the drilled hole) pressure and the flow of oil and gas, blowout preventers are intended to prevent tubing (e.g. drill pipe and well casing), tools, and drilling fluid... 09abf24155

Aviation fuel Most aviation fuels are kerosene-based—such as JP-8 and Jet A-1—and are used in gas turbine-powered aircraft. Air Force aircraft had been certified to operate on a 50-50 blend of kerosene and synthetic fuel derived from coal or natural gas, as part of an initiative. These fuels have more stringent requirements than those used for ground-based applications, such as heating or road transportation. fuels, and are used to power aircraft.
