Heat exchanger Cooling A heat exchanger is a system used to transfer heat between a source and a working fluid. Another example is the heat sink, which is a passive heat exchanger that transfers the heat generated by an electronic. Heat exchangers are used in both cooling and heating processes. Cooling Water Fouling. The classic example of a heat exchanger is found in an internal combustion engine in which a circulating fluid known as engine coolant flows through radiator coils and air flows past the coils, which cools the coolant and heats the incoming air. The fluids may be separated by a solid wall to prevent mixing or they may be in direct contact. They are widely used in space heating, refrigeration, air conditioning, power stations, chemical plants, petrochemical plants, petroleum refineries, natural-gas processing, and sewage treatment. trains has been successfully modeled as a first order reaction by Ebert and Panchal who expanded on the work of Kern and Seaton d33b331bc9
