A computer information system is a system, which consists of people and computers that process or interpret information. The term is also sometimes used to simply refer to a computer system with software installed. cdcec8dd16

As a database server, it is a software product with the primary function of storing and retrieving data as requested by other software applications—which may run either on the same computer or on another computer across a network (including the Internet) cdcec8dd16

Information system transaction processing systems, decision support systems, knowledge management systems, learning management systems, database management systems, and office information An information system (IS) is a formal, sociotechnical, organizational system designed to collect, process, store, and distribute information. From a sociotechnical perspective, information systems comprise four components: task, people, structure (or roles), and technology. Information systems can be defined as an integration of components

atomic commits In the field of computer science, an atomic commit is an operation that applies a set of distinct changes as a single operation. If there is a failure before the atomic commit can be completed, then all of the changes completed in the atomic commit are reversed. The most common uses of atomic commits are in database systems and version control systems. commit is processed at a time. Isolation ensures that only one atomic commit is processed at a time. This ensures that the system is always left in a consistent state. If the changes are applied, then the atomic commit is said to have succeeded. The other key property of isolation comes from their nature as atomic operations cdcec8dd16

Database The sum total of the database, the DBMS and the associated applications can be referred to as a database system. Often the term "database" is also used loosely to refer to any of the DBMS, the database system or an application associated with the database. The DBMS additionally encompasses the core facilities provided to administer the database. Interest in In computing, a database is an organized collection of data or a type of data store based on the use of a database management system (DBMS), the software that interacts with end users, applications, and the database itself to capture and analyze the data. capability, a number of general-purpose database systems emerged; by the mid-1960s a number of such systems had come into commercial use cdcec8dd16

Geographic information system The academic discipline that studies these systems and their A geographic information system (GIS) consists of integrated computer hardware and software that store, manage, analyze, edit, output, and visualize geographic data. In a broader sense, one may consider such a system also to include human users and support staff, procedures and workflows, the body of knowledge of relevant concepts and methods, and institutional organizations. Much of this often happens within a spatial database; however, this is not essential to meet the definition of a GIS.
