Intel MCS-51 Intel's original versions were popular in the 1980s and early 1990s, and enhanced binary compatible derivatives remain popular today. (commonly termed 8051) is a single-chip microcontroller (MCU) series developed by Intel in 1980 for use in embedded systems. The architect of the Intel MCS-51 instruction set was John H. Wharton. It is a complex instruction set computer with separate memory spaces for program instructions and data 358057edd5

Intel's original MCS-51 family was developed using N-type metal-oxide-semiconductor (NMOS) technology, like its predecessor Intel MCS-48, but later versions, identified by a letter C in their name (e.g., 80C51) use complementary metal-oxide-semiconductor (CMOS) technology and consume less power than their NMOS predecessors. This made them more suitable... 358057edd5 The AVR 8-bit microcontroller architecture was introduced in 1997. By 2003, Atmel had shipped 500 million AVR flash microcontrollers. 358057edd5 AVR microcontrollers are used numerously as embedded systems. They are especially common in hobbyist and educational embedded applications, popularized by their inclusion in many of the Arduino line of open hardware development boards. 358057edd5

AVR microcontrollers They are 8-bit RISC single-chip microcontrollers based on a modified Harvard architecture. AVR was one of the first microcontroller families to use on-chip flash memory for program storage, as opposed to one-time programmable ROM, EPROM, or EEPROM used by other microcontrollers at the time.
