Marine primary production The organisms responsible for primary production are called primary producers or autotrophs. Marine primary production is the chemical synthesis in the ocean of organic compounds from atmospheric or dissolved carbon dioxide. Almost all life on Earth relies directly or indirectly on primary production. It principally occurs through the process of photosynthesis, which uses light as its source of energy, but it also occurs through chemosynthesis, which uses the oxidation or reduction of inorganic chemical compounds as its source of energy. Morwell State School No. 2136 was opened on Thursday, 4 April 1879 on land off Tarwin Street. A permanent location where the school is currently found became the site for a new building in August 1880. The campus contained the school and a residence for the head teacher. At that time George Street separated the grounds from the Church of England, where St. Mary's church was built in 1886. Around 1960, George Street was closed at Chapel Street and the old church was incorporated into the school grounds. In 1906, the original structure was replaced by a brick building. a17b97228f == Name == a17b97228f Collins merged with Harper & Row in 1990, forming a new publisher named HarperCollins. a17b97228f

Globally the ocean and the land each produce about... a17b97228f Most marine primary production is generated by a diverse collection of marine microorganisms called algae and cyanobacteria. Together these form the principal primary producers at the base of the ocean food chain and produce half of the world's oxygen. Marine primary producers underpin almost all marine animal life by generating nearly all of the oxygen and food marine animals need to exist. Some marine primary producers are also ecosystem engineers which change the environment and provide habitats for other marine life. a17b97228f == Early life and education == a17b97228f
