Hepatitis E PMC 3298235. ISSN 1080-6040. 040706. "The global burden of hepatitis E
Hepatitis E is inflammation of the liver caused by infection with the hepatitis E virus (HEV); it is a type of viral hepatitis. PMID 15757573. 3201/eid1103. HEV is a positive-sense, single-stranded, nonenveloped, RNA icosahedral virus and one of five known human hepatitis viruses: A, B, C, D, and E. Hepatitis E has mainly a fecal-oral transmission route that is similar to hepatitis A, although the viruses are unrelated. Rein DB, Stevens GA, Theaker J, Wittenborn JS, Wiersma ST (2012) ee05bb15b6

Cardiology Cardiology is a branch of medicine that deals with disorders of the heart and the cardiovascular system, and it is a sub-specialty of internal medicine. Pediatric cardiologists are pediatricians who specialize in cardiology. The field includes medical diagnosis and treatment of congenital heart defects, coronary artery disease, heart failure, valvular heart disease, and electrophysiology. Physicians who specialize in cardiac surgery are called cardiothoracic surgeons or cardiac surgeons, a specialty of general surgery. Physicians who specialize in this field of medicine are called cardiologists. This condition causes newborns to have a bluish-tint Cardiology (from Ancient Greek καρδιά (kardiā) 'heart' and -λογία (-logia) 'study') is the study of the heart. enters the circulatory system resulting from a ventricular septal defect (VSD) right beneath the aorta ee05bb15b6

Varicella vaccine). Atlanta GA: Centers for Disease Control and Prevention Varicella vaccine, also known as chickenpox vaccine, is a vaccine that protects against chickenpox. It is given by injection just under the skin. Another vaccine, known as zoster vaccine, is used to prevent diseases caused by the same virus – the varicella zoster virus. One dose of vaccine prevents 95% of moderate disease and 100% of severe disease. Vaccinating a large portion of the population also protects those who are not vaccinated. Two doses of vaccine are more effective than one. SW, McIntyre L, Baldy LM (eds. Manual for the surveillance of vaccine-preventable diseases (5th ed. If given to those who are not immune within five days of exposure to chickenpox it prevents most cases of the disease.) ee05bb15b6

Like hepatitis A, hepatitis E usually follows an acute and self-limiting course of illness (the condition is temporary and the individual recovers) with low death rates in resource-rich areas; however, it can be more severe in pregnant women and people with a weakened immune system, with substantially higher death rates. In pregnant women, especially in the third trimester, the disease is more often severe... ee05bb15b6 Depending on product type and development stage... ee05bb15b6

Burn Most burns are due to heat from hot fluids (called scalding), solids, or fire. burns (70%) involve less than 10% of the TBSA. In the home, risks are associated with domestic kitchens, including stoves, flames, and hot liquids. Unit of measuring burns is VSD as 10% TBSA is

equal to 1VSD. There are a number of methods to determine A burn is an injury to skin, or other tissues, caused by heat, electricity, chemicals, friction, or ionizing radiation (such as sunburn, caused by ultraviolet radiation). Burns occur mainly in the home or the workplace. Burns can also occur as a result of self-harm or violence between people (assault). In the workplace, risks are associated with fire and chemical and electric burns. Alcoholism and smoking are other risk factors ee05bb15b6

The World Health Organization (WHO) recommends routine vaccination only if a country can keep more than 80% of people vaccinated. If only 20% to 80% of people are vaccinated it is possible that... ee05bb15b6

Clostridioides difficile infection Complications may include pseudomembranous colitis, toxic megacolon, perforation of the colon, and sepsis. Retrieved 20 January 2014. Symptoms include watery diarrhea, fever, nausea, and abdominal pain. Drekonja DM, Butler M, MacDonald R, Bliss D, Filice GA, Rector TS, et al. "Comparative effectiveness of Clostridium Clostridioides difficile infection (CDI or C-diff), also known as Clostridium difficile infection, is a symptomatic infection due to the spore-forming bacterium Clostridioides difficile. Antibiotics can contribute to detrimental changes in gut microbiota; specifically, they decrease short-chain fatty acid absorption, which results in osmotic, or watery, diarrhea. (December 2011). It makes up about 20% of cases of antibiotic-associated diarrhea ee05bb15b6

against three infectious diseases in humans: diphtheria, pertussis (whooping cough), and tetanus (lockjaw). The vaccine components include diphtheria and tetanus toxoids, and either killed whole cells of the bacterium that causes pertussis or pertussis antigens. The term toxoid refers to vaccines which use an inactivated toxin produced by the pathogen which they are targeted against to generate an immune response. In this way, the toxoid vaccine generates an immune response which is targeted against the toxin which is produced by the pathogen and causes disease, rather than a vaccine which is targeted against the pathogen itself. The whole cells or antigens will be depicted as either "DTwP" or "DTaP", where the lower... ee05bb15b6 The vaccine is generally safe, even for those infected by HIV. Most children do not experience any side effects; those that do occur are usually mild, such as fever, rash, pain at the site of injection, and joint stiffness; and are short-lived.... ee05bb15b6

Rabies vaccine Transmission of rabies virus to humans typically occurs through a bite or scratch from an infectious animal, but exposure can occur through indirect contact with the saliva from an infectious individual. There are several rabies vaccines available that are both safe and effective. In the United States, RABORAL V-RG (Boehringer Ingelheim, Duluth, GA, USA) has been the only licensed ORV for rabies virus management since 1997 The rabies vaccine is a vaccine used to prevent rabies. animals. Vaccinations must be administered prior to rabies virus exposure or within the latent period after exposure to prevent the disease ee05bb15b6

The polysaccharide antigens were used to induce type-specific antibodies that enhanced opsonization, phagocytosis, and killing of Streptococcus pneumoniae (pneumococcal) bacteria by phagocytic immune cells. The pneumococcal polysaccharide vaccine is widely used in high-risk adults. ee05bb15b6 Doses are usually given by injection into the skin or

muscle. After exposure, the vaccination is typically used along with rabies immunoglobulin. It is recommended that those who are at high risk of exposure be vaccinated before potential exposure. Rabies vaccines are effective in humans and other animals, and vaccinating dogs is... ee05bb15b6

First used in 1945, the tetravalent vaccine was not widely distributed, since its deployment coincided with the discovery of penicillin. In the 1970s, Robert Austrian championed the manufacture... ee05bb15b6 Burns that affect only the superficial skin layers are known as superficial or first-degree burns. Clinical trial These authorities are responsible for vetting the risk/benefit ratio of the trial—their approval does not mean the therapy is 'safe' or effective, only that the trial may be conducted. Clinical trials generate data on dosage, safety and efficacy. The protocol is the trial's "operating manual" and ensures all researchers perform the trial in the same way on similar Clinical trials are prospective biomedical or behavioral research studies on human participants designed to answer specific questions about biomedical or behavioral interventions, including new treatments (such as novel vaccines, drugs, dietary choices, dietary supplements, and medical devices) and known interventions that warrant further study and comparison. They are conducted only after they have received health authority/ethics committee approval in the country where approval of the therapy is sought. called a clinical trial protocol ee05bb15b6

Measles vaccine Ovsyannikova IG, Johnson KL, Naylor S, Poland GA (February 2005). Retrieved 21 July 2009. Nearly all of those who do not develop immunity after a single dose develop it after a second dose. It is unclear if it becomes less effective over time. The vaccine may also protect against measles if given within a couple of days after exposure to measles. The vaccine's effectiveness lasts many years. 2012. "Identification of HLA-DRB1-bound self-peptides following Measles vaccine protects against becoming infected with measles. When the rate of vaccination within a population is greater than 92%, outbreaks of measles typically no longer occur; however, they may occur again if the rate of vaccination decreases ee05bb15b6

Pneumococcal polysaccharide vaccine Atlanta GA: Centers for Disease Control and Prevention Pneumococcal polysaccharide vaccine, sold under the brand name Pneumovax 23, is a pneumococcal vaccine that is used for the prevention of pneumococcal disease caused by the 23 serotypes of *Streptococcus pneumoniae* contained in the vaccine as capsular polysaccharides. January 2020). "Chapter 11: Pneumococcal"; Manual for the surveillance of vaccine-preventable diseases. It is given by intramuscular or subcutaneous injection ee05bb15b6
