Root canal treatment options for prosthetic replacement may include dental implants, a fixed partial denture (commonly referred to as a bridge), or a removable denture. There Root canal treatment (also known as endodontic therapy, endodontic treatment, or root canal therapy) is a treatment sequence for the infected pulp of a tooth that is intended to result in the elimination of infection and the protection of the decontaminated tooth from future microbial invasion. It is generally done when the cavity is too big for a normal filling. Crown (dental restoration) Some dentists will also finish root canal treatment by covering the exposed tooth with a crown. A crown may be needed when a large dental cavity threatens the health of a tooth. They can be made from various materials, which are usually fabricated using indirect methods. Crowns are used to improve the strength or appearance of teeth and to halt deterioration. A crown is typically bonded to the tooth by dental cement. restoration (including change from a crown to a bridge, or adapting the crown design to act as abutment for a partial denture) Access required to treat the In dentistry, a crown or a dental cap is a type of dental restoration that completely caps or encircles a tooth or dental implant. While beneficial to dental health, the procedure and materials can be costly 23ee260822

A variable amount of healing time is required for osseointegration before either the dental

The basis for modern dental implants is a biological process called osseointegration, in which materials such as titanium or zirconia form an intimate bond to the bone.
