

Pain Control 2e

Inert gas asphyxiation Examples of physiologically inert gases, which have caused accidental or deliberate death by this mechanism, are argon, helium and nitrogen. gassing process which seem to cause no pain in some species, and for this reason many consider some types of controlled atmosphere killing more humane than Inert gas asphyxiation is a form of asphyxiation which results from breathing a physiologically inert gas in the absence of oxygen, or a low amount of oxygen (hypoxia), rather than atmospheric air (which is composed largely of nitrogen and oxygen). The term "physiologically inert" is used to indicate a gas which has no toxic or anesthetic properties and does not act upon the heart or hemoglobin. Instead, the gas acts as a simple diluent to reduce the oxygen concentration in inspired gas and blood to dangerously low levels, thereby eventually depriving cells in the body of oxygen d908c41110

Side effects associated with etifoxine use include slight drowsiness, headache, skin eruptions, and allergic reactions. In rare cases, etifoxine has been linked to severe skin and liver toxicity, as well as menstrual bleeding between periods. Unlike benzodiazepines, etifoxine does not cause sedation or lack of coordination. Etifoxine acts as a ligand for translocator proteins. d908c41110

Ureteral stent Taylor. invasive ureteric stent retrieval. One or both ends of the stent may be coiled to prevent it from moving out of place; this is called a JJ stent, double J stent or pig-tail stent. In "Stenting the Urinary System" 2E: Yachia, 2004, ISBN 1-84184-387-3 Martin Dunitz Minimally Invasive Ureteric A ureteral stent (pronounced you-REE-ter-ul), or ureteric stent, is a thin tube inserted into the ureter to prevent or treat obstruction of the urine flow from the kidney. The length of the stents used in adult patients varies between 24 and 30 cm. Additionally, stents come in differing diameters or gauges, to fit different size ureters. W. N. The stent is usually inserted with the aid of a cystoscope d908c41110

Negative-pressure wound therapy 2e. PMID 19287271. 10217. C. 0000347664. 36 (2): 202-211. It may also be considered after a clean surgery in a person who is obese. WON. Therapy Indications and Contraindications" Negative-pressure wound therapy (NPWT), also known as a vacuum assisted closure (VAC), is a therapeutic technique using a suction pump, tubing, and a dressing to remove excess wound exudate and to promote healing in acute or chronic wounds and second- and third-degree burns. A. doi:10. Continence Nursing. The use of this technique in wound management started in the 1990s and this technique is often recommended for treatment of a range of wounds including dehisced surgical wounds, closed surgical wounds, open abdominal wounds, open fractures, pressure injuries or pressure ulcers, diabetic foot ulcers, venous insufficiency ulcers, some types of skin grafts, burns, and sternal wounds. 1097/01.
