Rogue waves do not appear to have a single distinct cause but occur where physical factors such as high winds and strong currents cause... 4b7483f93d

Cliodynamics Cliodynamics relies on large bodies of evidence to test competing theories Cliodynamics () is a transdisciplinary area of research that integrates cultural evolution, economic history/cliometrics, macrosociology, the mathematical modeling of historical processes during the longue durée, and the construction and analysis of historical databases. Such questions can be explored with agent-based computer simulations. theories 4b7483f93d

Rogue wave rogue waves. Among other causes, studies of nonlinear waves such as the Peregrine soliton, and waves modeled by the nonlinear Schrödinger equation (NLS) Rogue waves (also known as freak waves or killer waves) are large and unpredictable surface waves that can be extremely dangerous to ships and isolated structures such as lighthouses. A rogue wave at the shore is sometimes called a sneaker wave. They are distinct from tsunamis, which are long wavelength waves, often almost unnoticeable in deep waters and are caused by the displacement of water due to other phenomena (such as earthquakes) 4b7483f93d

Its practitioners develop theories that explain such dynamical processes as the rise and fall of empires, population booms and busts, and the spread and disappearance of religions. These theories are translated into mathematical models. Finally, model predictions are tested against data. Thus, building and analyzing massive databases of historical and archaeological information is one of the most important goals of cliodynamics. 4b7483f93d

Bird conservation According to Worldwatch Institute, many bird populations are currently declining worldwide, with 1,200 species facing extinction in the next century. Other threats include overhunting, accidental mortality due to structural collisions, long-line fishing bycatch, pollution, competition and predation by pet cats, oil spills and pesticide. Carson's Bird conservation is a field in the science of conservation biology related to threatened birds. eggshells in species like the bald eagle (*Haliaeetus leucocephalus*) and peregrine falcon (*Falco peregrinus*), resulting in reproductive failures. Current estimates imply a total of nearly 11,000 extant species, suggesting that 11. 6% of all bird species, a near ratio of one in nine birds, have gone extinct over the last 126,000 years of human history. The biggest cited reason surrounds habitat loss. Bird conservation efforts aim to protect species and mitigate the decline of threatened bird population numbers 4b7483f93d
