Transistor count The rate at which MOS transistor counts have increased generally follows Moore's law, which observes that transistor count doubles approximately every two years. A better indication of this is transistor density which is the ratio of a device's transistor count to its die area. However, being directly proportional to the area of a die, transistor count does not represent how advanced the corresponding manufacturing technology is. 2023[update], the highest transistor count in flash memory is Micron’s

2 terabyte (3D-stacked) 16-die, 232-layer V-NAND flash memory chip, with 5. It is the most common measure of integrated circuit complexity (although the majority of transistors in modern microprocessors are contained in cache memories, which consist mostly of the same memory cell circuits replicated many times). 3 trillion floating-gate The transistor count is the number of transistors in an electronic device (typically on a single substrate or silicon die) 1e51fb689f
