Dielectrophoresis Consequently, fields of a particular frequency can manipulate particles with great selectivity. This Dielectrophoresis (DEP) is a phenomenon in which a force is exerted on a dielectric particle when it is subjected to a non-uniform electric field. Furthermore, a study of the change in DEP force as a function of frequency can allow the electrical (or. However, the strength of the force depends strongly on the medium and particles' electrical properties, on the particles' shape and size, as well as on the frequency of the electric field. Dielectrophoresis (DEP) is a phenomenon in which a force is exerted on a dielectric particle when it is subjected to a non-uniform electric field. This has allowed, for example, the separation of cells or the orientation and manipulation of nanoparticles and nanowires. All particles exhibit dielectrophoretic activity in the presence of electric fields. This force does not require the particle to be charged 90efa51177
