Just as BASIC was originally intended to be easy to learn, Microsoft intended the same for VB. Developing Visual Basic Add-ins, O'Reilly and Associates. Visual Basic for Applications enables building user-defined functions (UDFs), automating processes and accessing Windows API and other low-level functionality through dynamic-link libraries (DLLs). It supersedes and expands on the abilities of earlier application-specific macro programming languages such as Word's WordBASIC. It can be used to control many aspects of the host application, including manipulating user interface features, such as menus and toolbars, and working with custom user forms or dialog boxes.

BASIC related products are programmable with Visual Basic in one form or another, including LotusScript, which is very similar to VBA 6. The Host Explorer terminal

After that, he became a participant of the six-member Human Adaptability Project team (led by professor John Huizinga) of the former Institute of Human Biology at Utrecht University Medical School, as part of the International Biological Program, studying the population genetics and adaptation of savannah populations in sub-saharan Africa based on research among the Fali in northern Cameroon, among the Dogon in... Features components via the Component Object Model (COM) technology. In modern spreadsheet applications, several spreadsheets, often known as "worksheets" or simply "sheets", are gathered together to form a "workbook". A workbook is physically represented by a file containing all the data for the book, the sheets, and the cells with the sheets. Worksheets are normally represented by tabs that flip between pages, each one containing one of the sheets, although Numbers changes this model significantly. Cells in a multi-sheet book add the sheet name to their reference, for instance, "Sheet 1!C10". Some systems extend this syntax to allow cell references to different workbooks.
